Amendments to the Abstract:

Please amend the Abstract of the Disclosure as follows:

The invention relates to a A sealing arrangement (10) for sealing a gap between two components (12, 16) which can move rotationally with respect to one another about a common axis of rotation (18), having a brush seal (22) on which is arranged fixedly in a first component (12 or 16) and which interacts with a sealing surface (32) of the second component (16 or 12). The invention is distinguished by the fact that the The sealing surface (32) is conical in form, with at least one component (12 or 16) being axially displaceable and adjustable with respect to the other component in order to reduce the gap between the brush seal and the second component (16 or 12).
